**2B-BSED ENGLISH**

*Learning Activity 4.1 - Edgar Dale*

**1. If you teach a lesson on the concept of fractions to a grader, how will \you proceed if you follow the pattern in Dale's Cone of Experience beginning with the concrete moving toward the abstract?**

If I were teaching fractions to Grade 4 students', I would begin with the basics and then, I'll move toward abstract concepts, following Dale's Cone of Experience. As a teacher, I would not immediately introduce fraction symbols and formulas because learners at this grade may understand the lesson better if they can manipulate actual objects through senses such as touch, sight, smell, hearing, and etc. I would use real objects like pizza. I would cut a pizza into four equal slices and then I'll explain that each slice represents one-fourth (¼) of the whole pizza. I would let the learners divide the pizza themselves to experience how a whole can be divided into fractions. Also, I would provide paper circles, fraction tiles fraction strips if real food is not available. In addition, I would use visual materials, such as pictures of pizzas divided into different numbers of equal parts, diagrams, and fraction charts. These materials would help the learners recognize fractions even when they are no longer handling physical objects.

**2. Try to explain why reading teachers discourage us from reading only comics or illustrated comic version of novels?**

Commonly, Teachers discourage students from reading only comics or illustrated versions of novels because these materials often present stories through pictures/images and limited dialogue, which may not fully develop the learners' reading comprehension, vocabulary, and ability to interpret detailed written texts. According to Dale's Cone of Experience, pictures and visual symbols can help learners understand information, but they are more abstract or less direct than written novels. For example, when reading a novel, a student may encounter a passage describing a character's emotions and the sounds of the environment. In a comic version of novels, these details might be represented only by a single picture with a few lines of dialogue.

**3. How would you account for children who can label and identify the objects even if they have not actually seen them in reality?**

I would explain this by recognizing that children can acquire knowledge through indirect experiences, including pictures, videos, stories, and etc provided by other people. They do not necessarily need to encounter an actual object before learning its name or recognizing its appearance. Based in Dale's Cone of Experience, learners can gain information through pictures, visual symbols, and verbal symbols, even when they have not experienced the actual objects themselves. However, identifying an object does not always mean that the learner fully understands its characteristics and functions. For example, a child who has never seen a dragon in person may still identify one correctly because the child has seen pictures in books, watched movies and videos, or heard a teacher or someone describe it. The child may know that a dragon can fly with or without wings. However, the child may not fully understand its actual size, strength, or behavior in its natural habitat. As a future teacher, I would use this existing knowledge as a starting point for a deeper learning. I could show pictures of the dragon, play a video of its movements and behavior, and explain its habitat and characteristics. If possible. I would also ask the students questions such as, "What do you already know about a dragon?" and "Which of its characteristics have you learned from pictures or videos?" These questions would help me determine whether the students have accurate knowledge or merely recognize the animal visually. Through this approach, I could connect their previous learning to more concrete and meaningful experiences.

**4. Now that there is a great deal of ICT tools and applications used in enriching the lesson, how would you explain its potential use in instruction and where will you categorize it on the Cone?**

ICT tools and applications can make teaching and learning more interactive, accessible, and engaging. As a future teacher, I would use technology to present lessons through videos, animations, digital presentations, simulations, and etc. These tools can help the learners understand complicated concepts by presenting information through different sensory, such as sight and hearing. They can also provide opportunities for students to participate actively rather than simply listen to a teacher's explanation. For example, when teaching the water cycle in science subject. I could use an animated video to demonstrate the process of evaporation, condensation, and precipitation. I could then show a labeled diagram of the process and ask students to arrange the stages in the correct order using an interactive application. After that, I could ask them to explain the water cycle in their own words. In Dale's Cone of Experience, ICT tools cannot be placed in only one category because their classification depends on how they are used in the teaching-learning process. The same device can support different kinds of

learning experiences. In addition, if I were teaching the planets, I could begin with an animated video showing their movements around the Sun. This would fall under motion pictures. Next, I could present a labeled diagram to help students identify each planet, which would fall under visual symbols. I could then let students manipulate a digital solar system simulation to explore planetary positions and orbits. This would provide a more interactive, simulated learning experience. Lastly, I would ask students to explain what they learned and demonstrate their understanding through an activity or assessment.
